

# Ice Cream Sales

You own an ice cream parlor.

You wonder if you sell more ice cream when the weather is hot. To find out, you've had your assistant manager collect data for you to analyze.

The dataset **ice\_cream\_sales** contains the temperature and number of sales for the past few days.

Calculate the correlation between the temperature and the number of sales. Include a histogram to visualize the relationship between the two variables.

Your assistant manager is only a high school student who doesn't know much about organizing data, so you may need to manipulate the data he collected so that you can measure the correlation.
