*Datasets and Data Types*

# Datasets

A **dataset** is a structure for storing information.

Example of a dataset:

	Miles	Kilometers	Conversion_Rule
1	26.22	42.2142	Miles = 1.61 * Kilometers

<https://powcoder.com>

A dataset is organized into rows and columns (i.e., tabular data). Each row is called an **observation** and each column is called a **variable**. Each variable must have a name. Observations are identified by number.

Variables can be either of two types: **numeric** or **character**. *An observation can include variables of different types, but all of the observations for a particular variable must be of the same type.*

# Data Types

**Numeric** data can only contain valid combinations of the following characters:

0 1 2 3 4 5 6 7 8 9 + - . E

Numeric data has a size limit of 8 bytes, which corresponds to maximum number of around  $9 \times 10^{15}$  (i.e., 9E15). Missing data is represented by a dot (.)

There is no restriction on what can be stored as **Character** data. The size limit (>32k) is almost never an issue in practice. Missing data is represented by a blank (note: not a space). Note that character data is case-sensitive.

Generally, only use the numeric type on data for which mathematical operations may be performed. Otherwise, use the character type, which stores data more efficiently.

# Dates

**Dates** are a special case of numeric data.

In the SAS date system, each date is represented by an integer, with 0 corresponding to January 1, 1960.

Assignment Project Exam Help

Examples of the SAS date system:

January 10, 1960 corresponds to 9

<https://powcoder.com>

October 31, 1995 corresponds to 13087.

May 15, 1810 corresponds to -18128.

Add WeChat powcoder

Since dates are numeric data, missing values are represented with a dot.

Date data is usually displayed using a date **format** so as to be more intuitive to work with.

# Naming Rules

The following rules apply to naming datasets as well as to naming variables:

Only letters, digits, and underscores may be used.

Names cannot begin with digits.

Names cannot be longer than 32 characters.

Names are not case sensitive.

Example of a valid name: MyData\_2016\_10\_11

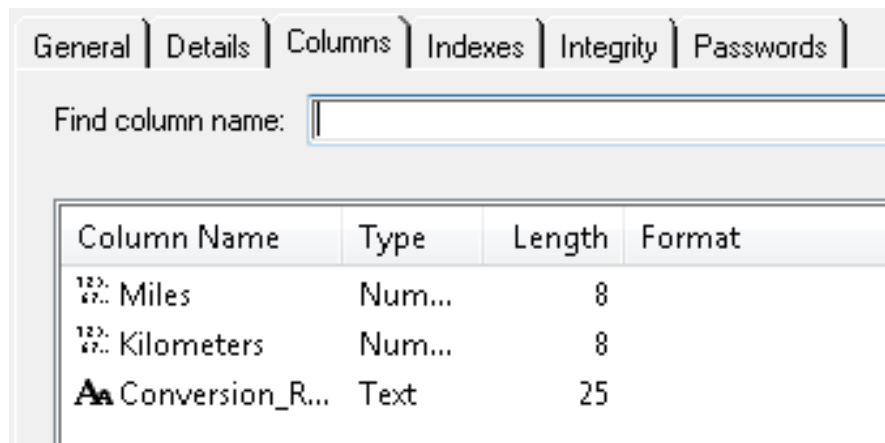

Example of an invalid name: 2016 10 11.MyData

# Dataset Properties

Datasets are listed in the Explorer Window. Double-click a dataset to open it in the Viewtable Window.

Edit Mode can be used to modify datasets in the Viewtable Window. Right-click a dataset to open Properties Window.

# Practice

Of the eight items listed below, identify the ones that could be stored as numeric data:

36105

3.14159

hello

<blank space>

1.1E4

ten

.

123...4

# Practice

Of the eight items below, identify the ones that are valid names in SAS:

Losss-2016

losses

Losses\_January\_01\_2016\_to\_December\_31\_2016

\_2016\_Losses

Losses

Losses!

Losses\_2016

2016\_Losses
